

ABSTRACT OF THE DISCLOSURE

The Crystal form P of a compound of formula (I)

having 2-theta angle positions in the powder X-ray diffraction pattern of 6.6° and 6.5°, Crystal form D of the compound having 2-theta angle positions in the powder X-ray diffraction pattern of 7.1°, 13.5° and 14.2°; and Crystal form D X-hydrate of the compound having 2-theta angle positions in the powder X-ray diffraction pattern of 7.1° and 14.2°. These compounds are useful as pharmaceutical materials because of their low residual solvent level, high stability, and ease of handling.
